Summary

Senior Software Engineer with 5 years of experience building production web and blockchain systems, from React/Next.js frontends to NestJS and Go backends and Solidity smart contracts. Since June 2025, a dedicated developer and team lead working directly with a Hong Kong-based client on multi-chain stablecoins, a cross-chain bridge, an asset-migration portal and crypto payments across multiple chains. Experienced in KYC integration, multisig approval flows, event-driven architecture and Agile delivery with clients.

Education

University of Science and Education - The University of Da Nang
Bachelor of Information Technology in Information Technology — *Aug 2018 - Jul 2023*

Experience

Var Meta — DaNang - VietNam
Senior Software Engineer (Fullstack Blockchain, Team Lead) — *Mar 2024 - Present*

- Work as a dedicated developer and team lead directly with a Hong Kong-based client (since Jun 2025): join client calls, clarify requirements, estimate and assign tasks, and report progress and risks.
- Own delivery across Solidity/Foundry contracts, NestJS and Go backends, and React/Next.js web apps for stablecoin, cross-chain bridge, asset-migration and payment products across multiple chains (Ethereum, Arbitrum, QDay, Abelian).
- Architected high-level designs tailored to client requirements, covering component structure, state management and data flow before implementation.
- Run Agile/Scrum delivery (Daily, Sprint Planning, Review, Retrospective), refine the backlog with the client and deliver sprint commitments across multiple repositories.
- Mentor developers through code reviews and best-practice sharing; established coding standards and maintainability guidelines that reduce technical debt and keep code consistent.
- Set up per-repo CI/CD with semantic-release and split a monorepo into independent repositories managed by a manifest repo.

VTI Academy — DaNang - VietNam
Frontend Instructor — *Jan 2024 - Dec 2024*

- Developed and delivered a frontend curriculum covering HTML, CSS, JavaScript, TypeScript, React and Next.js, tailored toward real-world application development.
- Guided students through hands-on projects emphasizing component design, state management and performance optimization.
- Evaluated student progress and learning outcomes, contributing to a course satisfaction rate of approximately 85%.

Hitachi Digital Services — DaNang - VietNam
Software Engineer (Developer, Sub Leader) — *Jan 2022 - Mar 2024*

- Collaborated with clients and internal teams to analyze functional requirements, clarifying business logic for precise task translation to the development team.
- Executed projects within a Waterfall framework, ensuring alignment with technical specifications and quality standards.
- Managed task breakdown and estimation using Redmine/Jira; acted as sub-leader, assigning tasks and reviewing deliverables to meet client expectations.

Projects

Cross-chain Bridge (Non-custodial) | *Solidity, UUPS Proxy, Gnosis Safe, EIP-712, Go, Next.js, Wagmi v2*

- Designed and launched a non-custodial cross-chain bridge between two blockchain networks, overseeing development from smart contract architecture to UI delivery within 5 months.
- Engineered the core bridge contract with enhanced security features and economic outflow management, plus a liquidity pool contract enforcing transfer caps without disrupting concurrent transactions.
- Developed an on-chain approval workflow with Gnosis Safe integration and a signing UI; delivered a bridge UI with direct contract interaction and real-time order tracking.
- Hardened the Go relay (resumable orders after RPC failures, pause-state guards, refund reconciliation) and built operator tooling: de-duplicated low-balance and multisig alert emails, treasury views and fund-provenance reports.

Cross-chain ERC-20 Token Migration Portal | *Solidity (Foundry), Go, rindexer, Next.js, React, Gnosis Safe*

- Built a one-way, time-boxed portal that migrates multiple ERC-20 tokens from one chain to its successor chain: users lock on the source chain and the relayer releases from a pre-funded pool on the target chain.
- Worked across all layers: contracts (large-order threshold, refund and multisig review roles, migration end-time guards), Go relay and admin backend, event indexer, user dApp and admin portal.
- Routed large orders to Gnosis Safe multisig review with automatic refund on rejection, and a manual-processing path after repeated release failures.
- Introduced versioned SQL migrations and split the backend into eight independent repositories with PR/release pipelines.

Multi-chain Stablecoin Platform | *Kafka, NestJS, Gnosis Safe, EIP-712, JWT, Socket.IO, Redis, Sumsub, AWS KMS*

- Developed an event-driven microservices architecture using Kafka with per-chain topics, and a multi-chain Blockchain Crawler handling minting and transactions on both EVM and non-EVM chains (Ethereum, Arbitrum, QDay, Abelian).
- Implemented mint and redeem flows end to end (request lifecycle, fees, order expiry, treasury operations), signing transactions with AWS KMS and preventing nonce collisions between parallel workers via database-level wallet locking.
- Integrated Sumsub for KYC/KYB with post-approval onboarding, and implemented JWT-based SSO with token refresh and 2FA across services.
- Created a Gnosis Safe multisig signing UI in the Admin portal (EIP-712); integrated wallet risk screening and rate limiting to secure mint/redeem requests.
- Designed a real-time notification layer with Socket.IO and Redis for the Admin and platform backends.

Crypto Payment Platform | *Vite.js, TypeScript, Figma, Golang, Fern*

- Led end-to-end development, collaborating with customers to gather requirements and propose technical solutions; defined frontend architecture standards and guided implementation.
- Created Figma wireframes to validate concepts with customers, and designed payment flows with frontend and backend engineers, including integration diagrams and webhook-based notifications.
- Assisted Golang backend development by fixing bugs, and built SDKs and API documentation with Fern.

NFT Minting DApp | *ERC-1155, Avalanche, Thirdweb, React, Tailwind CSS, Docker*

- Deployed an ERC-1155 contract on Avalanche with Thirdweb CLI and integrated the Thirdweb SDK for wallet connection and minting.
- Built a responsive minting interface with React, Shadcn-UI and Tailwind CSS; added Google Analytics to track user interactions.
- Configured Nginx, Docker and GitLab CI/CD to automate AWS EC2 deployment.

Stock Exchange Platform | *React, Webpack 5, TypeScript, TradingView, MQTT, Web Workers*

- Established a micro-frontend architecture with React, Webpack 5 and TypeScript for integration with legacy systems; defined frontend standards and conducted implementation reviews.
- Spearheaded advanced features such as TradingView chart customizations and a real-time order book via MQTT.
- Optimized frontend performance with web workers and caching; worked with backend teams on API integration and frontend security.

Multi Service Platform - Image Analysis (MSPF - IVA) | *React, Next.js, Docker, Jest, Selenium, Python*

- Clarified requirements with customers, assigned tasks, conducted implementation reviews and packaged source code with Docker for client delivery.
- Engineered UI features including dynamic forms and multi-chart visualizations; wrote Jest unit tests and supported automation testing.

Multi Service Platform - Video Multi Service (MSPF - VMS) | *HLS, JavaScript, React*

- Translated client design documents into development tasks; built video playback features and custom API handling, and fixed bugs in legacy screens.

E-Learning Platform | *Next.js, GitLab CI/CD, AWS EC2, AWS S3*

- Refined requirements with BAs, established the Next.js admin codebase for course data and contributed to fullstack features.
- Implemented a GitLab CI/CD pipeline for automated deployment on AWS EC2 and used S3 for file storage.

Technical Skills

Blockchain: Solidity, Foundry, UUPS Proxy, ERC-20, EIP-712, Gnosis Safe, Wagmi, Viem, RainbowKit, Ethers, Sumsub (KYC)
Languages: TypeScript, Golang, Solidity
Frontend: React, Next.js, Vite, Zustand, Redux, TanStack Ecosystem, MUI, TailwindCSS, Shadcn, Webpack
Backend: NestJS, NodeJS, Express, Restful-API, Kafka, BullMQ, Socket.IO, Prisma, TypeOrm
Databases: PostgreSQL, MongoDB, Redis
Cloud / DevOps: AWS (EC2, S3, SES, KMS, Secrets Manager), Docker, GitLab CI/CD, GitHub Actions, Nginx
Testing: Jest
Tools: Git, SVN, Jira, Redmine

Certifications

IELTS Overall Band 6.5 - IDP (Dec 2025)
